

fundamentals of python day1

Print Statement:

The print statement in Python is used to display information on the screen.

Syntax: print(expression)

Example:

```
print("Hello, World!")
```

Comments:

Comments in Python are used to explain code and are not executed.

Single-line comments start with #, and

multi-line comments are enclosed in triple quotes (''' or ''').

```
# This is a single-line comment
```

```
'''
```

```
This is a  
multi-line comment
```

```
'''
```

Data Types:

1. int:

- Stands for integer.
- Represents whole numbers without any decimal point.

Example:

```
x = 5
```

float:

- Stands for floating-point number.
- Represents real numbers with a decimal point.

Example:

```
y = 3.14
```

str:

- Stands for string.
- Represents a sequence of characters.
- Strings are enclosed in single (`' '`) or double (`" "`) quotes or triple quotes (`''' '''`)

Example:

```
name = "Alice"
```

Python Keywords:

Keywords are reserved words that have special meanings in Python.

Examples: if, else, for, while, def, class, return, etc.

36 keywords

PYTHON LIFE

```
['False', 'None', '__peg__parser__', 'True', 'and',  
'as', 'assert', 'async', 'await', 'break', 'class',  
'continue', 'def', 'del', 'elif', 'else', 'except',  
'finally', 'for', 'from', 'global', 'if', 'import',  
'in', 'is', 'lambda', 'nonlocal', 'not', 'or',  
'pass', 'raise', 'return', 'try', 'while', 'with',  
'yield']
```

Variables:

- Python Variable is containers which store values.
- Python is not "statically typed".
- We do not need to declare variables before using them or declare their type.

- A variable is created the moment we first assign a value to it.
- A Python variable is a name given to a memory location.
- It is the basic unit of storage in a program.

Rules for creating variables in Python:

- A variable name must start with a letter or the underscore character.
- A variable name cannot start with a number.
- A variable name can only contain alpha-numeric characters and underscores (A-z, 0-9, and _).
- Variable names are case-sensitive (name, Name and NAME are three different variables).
- The reserved words(keywords) cannot be used naming the variable.

Variable Cases:

There are 3 types of variable cases in python:

1.Camel Case

2.Snake Case → python programming language

3.Pascal Case
