

Dictionary of words

Create a program that manages a dictionary of word meanings. The program should allow users to perform the following actions:

1. **Add a Word:** Allow users to add new words along with their meanings to the dictionary.
2. **Search for Meaning:** Enable users to search for the meaning of a word in the dictionary.
3. **Display All Words:** Provide an option to display all words and their meanings currently stored in the dictionary.
4. **Update Meaning:** Implement a feature to update the meaning of an existing word in the dictionary. After updating, display the updated meaning.
5. **Delete Word:** Implement a feature to delete a word and its meaning from the dictionary. Confirm the deletion and handle cases where the word doesn't exist.

Ensure the program handles invalid inputs gracefully. Use a while loop to keep the program running until the user chooses to exit.
