

Quiz Questions:

Questions

1. **Question:** What do identity operators (`is` and `is not`) check in Python?
 - a) Value equality
 - b) Memory address identity
 - c) Type equality
 - d) Sequence membership
2. **Question:** Which of the following statements is correct for the identity operator `is` ?
 - a) `x is y` is True if the values of `x` and `y` are equal.
 - b) `x is y` is True if `x` and `y` refer to the same object.
 - c) `x is y` is True if the type of `x` and `y` is the same.
 - d) `x is y` is True if `x` and `y` are both None.
3. **Question:** What do membership operators (`in` and `not in`) check in Python?
 - a) Memory address identity
 - b) Type equality
 - c) Value equality
 - d) Sequence membership
4. **Question:** Which membership operator is used to check if a value is not present in a sequence?
 - a) `in`
 - b) `not in`

Coding Exercise:

1. **Exercise:** Create a program that takes user input for their name and age. Use formatted strings (f-strings) to print a message welcoming the user and

stating their age.

2. **Exercise:** Write a Python script that defines a dictionary with information about a product (e.g., name, price, quantity). Use formatted strings to display the information in a readable format.
3. Create a list called `numbers` that contains integers from 1 to 10.
 - Check if the number 5 is in the list.
 - Check if the number 15 is not in the list.
