

fundamentals day 1 task

- Create a Python script with both single-line and multi-line comments explaining the purpose of the script.
- Declare two variables, one storing an integer and the other a string. Print their values.
- Write a program that prints a pattern using multiple print statements.
- Create a Python script for a simple task and add comments to explain each step.
- Create variables of different data types(int,float,int) and print their values.
- Determine the data type of a variable.

```
# Expected Output:  
# The data type of variable x is <class 'int'>.
```

- Display the memory addresses

```
# The memory addresses of x and y  
x = 10  
y = 10
```
