

Coding Exercise

1. Print Statement:

- Write a Python program that prints your name.

2. Comments:

- Create a Python script with both single-line and multi-line comments explaining the purpose of the script.

3. Data Structures & Data Types:

- Define a list containing three different data types.

4. String Operations:

- Concatenate two strings and print the result.
- Repeat a string three times and display the output.

5. Python Keywords:

- Create a variable with a name that is a Python keyword. What happens?

6. Python Variables:

- Declare two variables, one storing an integer and the other a string. Print their values.

7. Type Conversions:

- Convert a float to an integer and print the result.
- Convert an integer to a string and display the output.

8. Simple Input & Output:

- Take the user's age as input and print a message using that input.

Exercise:

1. Print Statement:

- Write a program that prints a pattern using multiple print statements.

2. Comments:

- Create a Python script for a simple task and add comments to explain each step.

3. Data Structures & Data Types:

- Implement a program that uses a dictionary to store information about a book (title, author, publication year).

4. String Operations:

- Write a python program that takes a string as input (35) and return float value.

5. Python Keywords:

- Explore True and False Python keyword not mentioned earlier and provide examples of how they are used.

6. Python Variables:

- Develop a script that swaps the values of two variables without using a temporary variable.

7. Type Conversions:

- Create a program that takes user input for their age, converts it to an integer, adds 5, and then prints the result.

8. Simple Input & Output:

- Build a calculator program that takes two numbers as input and performs the arithmetic operation.
